**AMENDMENTS TO THE CLAIMS**

1. (Original) A lens control system having an auto focus device which drives a focus of a photographing lens for automatic focusing and a manual focus device which drives the focus of said photographing lens by manually operating a predetermined operation member, the system comprising:

an instructing device which instructs on recording of the focus position set by focusing executed by said auto focus device; and

*msp*  
a focus recording position display device which displays the focus position the recording of which has been instructed on by said instructing device so that the focus position can be <sup>referenced</sup> ~~reference~~ when said manual focus device executes focusing.

2. (Original) The lens control system according to claim 1, wherein said focus recording position display device displays on a display screen that displays a present focus position, the focus position the recording of which has been instructed on by said instructing device and the present focus position so that it can be determined whether or not these focus positions are matched.

3. (Original) A focus information display apparatus which displays information on a focus of a photographing lens, the apparatus comprising:

a focus position storage device which stores a desired focus position of said photographing lens or a focus operation signal as a focus stored position;

a focus present position acquiring device which acquires a present focus position or a focus operation signal as a focus present position; and

a display device which displays information indicating how said focus present position and said focus stored position are close to each other.
